

The role of context

- Generative systems work only with what is in the context
 - instructions received
 - text provided by the user
 - any attached documents
 - previous messages in the conversation
- Problem 1: too little context
 - generic response
 - fabricated details
 - task misinterpreted
- Problem 2: too much context
 - loss of focus
 - loss of relevance
 - less precise response

Accessing Knowledge: But Which Knowledge?

- In professional settings, one should not ask the system to answer on the basis of its general knowledge.
- It would be like asking a question to someone who has read a great deal, but about whom we do not know:
 - which sources they have internalized
 - how reliable they are for our task
 - how up to date they are
 - whether they are appropriate to the specific administrative context
- The result could be a plausible answer, but not necessarily correct, relevant, or professionally appropriate.
- In administrative work, the system must work on the knowledge that we decide to make available to it.

Questions should always be asked with sources attached

- A generative system can analyze materials provided to it in the context of the conversation
 - attached documents
 - text pasted into the prompt
 - excerpts from regulations, acts, reports, procedures
 - sets of materials selected by the user

Answer the question using only the context provided
If the answer is not present in the materials, write:
"Information not present in the documents provided."

Context:

[documents or excerpts]

Question:

[question]

Answer format:

- brief answer
- citation of the relevant passage
